

Winch Cable Hookup

Install the rear pulley on the tail truss. Make a hole in the roof where the winch cable will go through. Ream the hole out to $\frac{3}{4}$ " diameter. Feed the winch cable up and out through the hole.

Lay the cable over the pulley and install the retainer bolt. This bolt keeps the cable from lifting out of the pulley. Install the eyebolt cable assembly.

Dress the cable from the nosehouse over the topping pulley and install the retainer bolt. Using **ONLY THE PROVIDED CONNECTING LINK**, hook the cable from the eyebolt to the cable from the winch.
