

## **Installing Fascia**

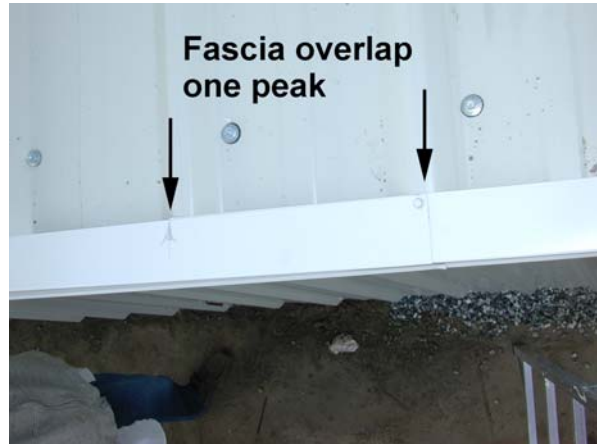

Start installing the fascia at the rear peak of the tailhouse roof. At the back corner of the roof, mark the fascia, and make a cut on the top edge.

Bend the front edge of the fascia at a 90-degree angle around the corner.

Continue installing the fascia along the side of the roof. When you need to make a joint, overlap the fascia by one peak. If you overlap more than this you will run out of fascia before you have covered all the edges.

Install fascia around all roof edges using the technique described above.

When you finish installing the fascia walk around the hangar looking for any places that have open gaps and seal them with the white caulk provided.
